

DESTROY THIS PAPER WHEN YOU ARE DONE

These numbers are the wallet. Anyone who reads them can spend the money, and they need nothing else. This sheet is a checking tool with one job, and once that job is done it is only a hazard. **It is not a backup. Your backup is the words, on a different sheet.**

WHAT TO DO, IN ORDER

1. **Roll one die sixty times** and write each result in the next box, left to right.
2. **Press the matching button in the app after every throw**, before throwing again.
3. **Compare, row by row, before pressing Derive.** The app shows your rolls in rows of ten, numbered as below. This is the only way to catch pressing 4 when the die showed 5: every other check compares your rolls against a second tool, and two tools given the same wrong number agree perfectly.
4. **Write the words** on a different sheet, and keep those.
5. **Destroy this sheet.** Burn it, or shred it and separate the pieces. Not the recycling, not the bin, not a drawer "for now".

WHAT THESE ROLLS ARE FOR

- ☐ A seed phrase, the wallet itself
- ☐ A backup key, which encrypts a backup

One sheet for one purpose, and never the same numbers for both: a backup key made from the wallet's own rolls can be worked out from the wallet it is protecting.

YOUR ROLLS, SIXTY OF THEM

from	ten rolls per row									
1										
11										
21										
31										
41										
51										

Sixty boxes, and fill them all: that is what a new twelve-word seed should have. The heavier line falls after 50, the vendor minimum, which is enough to reproduce a seed already made that way and thin for a new one.

Whatever comes up is your log. Never re-roll because a run looks wrong: six 6s together is as likely as any other six throws, and starting again because the numbers looked odd makes the result weaker, not stronger. If a die lands off the table or leans against something, that throw does not count: throw again and write only the second result.
